

Asprova's "Pocket manual" series No.8 **Operation splitting techniques**

Use the Upload selected operations command to automate routine work

Asprova Corporation November 2008 (Ver.6) http://www.asprova.com/

What is the Upload selected operations command?

We have added the "Upload selected operations command" to Ver.6.0.0 for acquiring operations selected with GUI, such as Gantt resource charts, and for executing assignments and other tasks.

▲Fig. 1 Screen parameter using the Upload selected operations command

We have prepared a command by preset that groups together the same items and reassigns them as shown in Fig. 1. Use of this command allows automation of operations that have had to be done manually before.

One example is to select the operation from a menu to be coordinated in a chart. Or you can use the method of embedding the operation in a tool button.

Using the command as a macro

The command can be used for purposes other than reassignment such as acquiring operations selected in charts. It can also be used for titles and as a macro to change properties such as clearing split settings of selected operations

The usual way that must be used for clearing a split is to display the property-editing dialog for the operation and then delete, manually, the property in the "Split" tab.

This may cause little confusion and inconvenience if there are just one or two jobs, but if the routine work piles up and the volume of operations gets large, it will take a lot of time and trouble.

Edit Operation		
	Property	Value 🔼
	⊑5:20	5:20
	 Split number 	5
	–⊞ Split ratio (0)	
	 Split parallel number 	2
	 Operation split size MIN 	
	 Operation split size MAX 	✓
	General λ Split λ Assignment λ Results λ Evalua	
		OK Cancel

Now, let's automate this procedure.

Create the planning parameters for use in executing commands in the "Schedule"-"Command Editor" menu.

Select the "Gantt chart bar popup menu" in the" Command List" and "Custom Command" combo box. Click on the "New" button in custom commands to create a new command. In this example, we create a command called "Unsplit".

When we do that, the new command "Unsplit" is added to the command list.

Then, the new command is added. Since we first need to acquire the selected operations, we add the command

Upload selected operations

To that, we add

Filter operations ←Excludes operations that are not change objects

▲Fig. 5 After adding relevant command types

Click on the "OK" button to close the box and add the command, "Unsplit," to the popup menu's "executable commands" list.

That creates the command for macro execution. Now, assign the macro content.

▲Fig. 6 After adding the command

Assign content to the macro

To change properties, assign the

Modify properties

property editing expression. Here is where you will delete the split setting for the operation in "Operation expression." The assignment expression is:

ME.Parent.Work_SplitNumber=DELETE

This is a simple explanation of the expression assignment. Split operations will have the configuration shown below. For this reason, if the split is from split child operations then the value of the parent operations split number must be deleted.

That allows the assignment of macro content.

Two important points about using the Upload selected operations command as a macro are:

- Create new commands in the command editing dialog as "Gantt chart bar popup menus".
- ② Commands for automating such items as Modify properties and Upload selected operations are added to the commands in ①.

The methods for using commands as macros are not just for the clearing of operation splits that has been introduced here. They can also be used for changing status and for changing properties of orders.

Putting this function to good use will allow the automation of every-day routine work. Definitely give it some thought.
